1. Introduction

In this study, the test characteristics of the Biozek COVID-19 IgG/IgM Rapid Test Cassette was evaluated in clinical serum samples from 50 patients with PCR proven COVID-19 and 200 PCR negative patients with respiratory symptoms.

2. Adherence to Regulatory Standards

All portions of this study performed at the ISO certified testing facility adhered to the applicable standard operating procedures (SOPs) with any applicable protocol amendments specified in the study report, but was not conducted in compliance with international good laboratory practice (GLP) regulations.

3. Responsible personnel

4. Material and Methods

SARS-CoV-2 serology

The presence of SARS-CoV-2 IgM and IgG antibodies were determined by performing the Biozek COVID-19 IgG/IgM Rapid Test Cassette (Biozek) on serum, following the manufacturer's instructions. Very weak IgM bands were regarded as aspecific, only clear IgM bands were considered positive.

SARS-CoV-2 PCR

The presence of SARS-CoV-2 RNA was determined by performing an in house PCR protocol according to the protocol as provided by the WHO, detecting the E-gene of the virus on respiratory samples of the nasopharynx, oropharynx, sputum of bronchoalveolar lavage fluid (Corman *et al.*, 2020).

Patient serum samples

All serum samples used in this study were routinely collected during treatment by their physician as part of the diagnostic work up. For each serum sample, the days between onset of disease and serum collection was registered.

Samples drawn from 0 to 6 days after disease onset were regarded as early stage samples, from 7 to 13 days as intermediate stage and from 14 days as convalescence. For each patient, age, sex, stage of the disease and disease severity were registered.

Patient groups

PCR positive patients were 75 patients having at least one positive PCR for SARS-CoV-2.

PCR negative patients were 200 patients treated by their physician with respiratory symptoms having a negative SARS-CoV-2 PCR. Patients with diagnosed COVID-19 by chest CT abnormalities typical of COVID-19 (CORADS score 3-5) were excluded, as the negative PCR in these patients was regarded false negative due to a low sensitivity of the PCR in upper respiratory samples in this later stage of the disease. Patients who were hospitalized were considered as having severe disease, non-hospitalized patients were regarded as having mild disease.

5. Results and Discussion

Sensitivity of the Biozek COVID-19 IgG/IgM Rapid Test Cassette

Of the 75 PCR positive patients, including early, intermediate and convalescent stages of infection, a total of 57 patients were IgG positive and 12 patients were IgM positive (appendix 1).

In the convalescent phase (14 days or later after onset of symptoms), 48 of 52 patients were IgG positive (92.3%). The 4 IgG negative PCR positive patients all had mild disease.

Of the severely ill patients, all 14 IgG negative samples were drawn less than 10 days after onset of symptoms. All 11 IgG positive samples were drawn on day 6 or later. No sample drawn later than 10 days was IgG negative, giving an IgG sensitivity of 100% in severely ill patient in the convalescent stage.

Of the mildly ill patients, 45 of 49 PCR positive patients were IgG positive in the convalescent stage of disease, giving an IgG sensitivity in mild disease of 91.8% in the convalescent stage.

Of 75 PCR positive patients, 12 were IgM positive. In the early and intermediate stage, 16 of 23 patients were IgM negative and 7 IgM positive, giving an IgM sensitivity <14 days after onset of 30.4%. The 5 IgM positive patients in the convalescent stage all were IgG positive as well.

Specificity of the Biozek COVID-19 IgG/IgM Rapid Test Cassette

Of the 200 PCR negative samples, all were IgM negative and 1 was IgG positive (appendix 2), giving an overall specificity of 100% for IgM and 99.5% for IgG. It is unknown whether the IgG positive PCR negative patient suffered from COVID-19 earlier, before the PCR sample was taken.

No cross reactivity was found in samples from 11 patients who were infected with non-SARS coronaviruses, that were part of the PCR negative control group.

Conclusion

In conclusion, the Biozek COVID-19 IgG/IgM Rapid Test Cassette was able to detect past infections accurately, with an overall IgG sensitivity of 92.3% in the convalescent phase. The sensitivity depends on the timing of testing and severity of the disease. While past infections can be missed in some cases due to the sensitivity of 91.8% in mild infection, the test has an excellent sensitivity of 100% in this study in severe infections in convalescence.

The high specificity and absence of cross reactivity with other coronaviruses diminishes the chance of false positive results, which is very important when the test is used to determine past infection and possible immunity.
